ConvertFiles, Java XML, Java XML HTML, XHTML Java, XML Java, Convert Java to XHTML, Convert HTML to Java. Jambi is an intelligent module system. Jambi is based on a tree structure which makes the modules easy to search and replace. The structure of Jambi is based on the concept of "has-a". That is, any module should be able to add, remove, or replace any other module. Jambi allows modules to declare dependencies on other modules, and the module system and compilation algorithm will take care of sorting the dependencies out in such a way that no module is required at runtime to find out what its dependencies are. The basic principles of Jambi can be summarized as follows: 1. Modules specify interfaces that are used by other modules. Each module has exactly one interface. 2. Modules specify which other modules they use, and modules are not required to identify their dependencies on any particular module. 3. A module can be a class, a method, a field, or anything else that is small enough to fit into the Java heap. 4. In a Jambi module system, modules can refer to other modules by name. 5. At compilation time, Jambi creates an executable class file for each module in the system. 6. At runtime, a module's method implementations and fields are loaded from the modules that depend on it. 7. The only way that a module can communicate with other modules is by calling their methods. To ensure that the compilation and runtime behavior of a Jambi module system is as efficient as possible, Jambi assumes that: a) Every class or interface is immutable. b) Every method is either static or abstract. c) Every class is abstract. d) Every field is

primitive or an instance of a class that is explicitly marked as mutable. e) Every field that is not mutable is a constant. The interface in Java is usually seen as having a public, static, and final qualifier. A class that is public and static may be instantiated as many times as necessary and has a final qualifier is considered immutable. The module in Java is a small program that is compiled into an executable class file.
